Mean 9.510; Variance 7.769; scale 1.224 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting claim 6; Page 57-60; Brpp. English.

Claim 6; Page 57-60; Brpp. English.

To identify a cDNA from sugar bet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solanum tuberosum citrate synthase cDNA (T04199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is given in T04200.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The potato citrate synthms (CS) gene or cDNA sequence encoding CS (T03410) may be used to produce antisense CS sequences. CS DNA sequences are useful for altering CS activity in plants. Antisense CS sequences can be used to inhibit CS expression in plants and has the effect of inhibiting flower formation and by doing so improves the plant's storage capacity. This is partic. useful in crop plants of any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of sequence 1891 BP; 370 C; 425 G; 584 T;

DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting to improve storage of tubers, etc. and to reduce sprouting to improve storage of tubers, etc. and to reduce sprouting of an expensive spring in a cDNA from potato which codes for citrate synthase, a cDNA fragment of citrate synthase from Arabidopsis thaliana was firstly amplified using A.thaliana cDNA and oligos T04.02 and T04.03 which are complementary to the 5 or 3 'end of the coding region of A. thaliana cDNA for citrate synthase. The oligos additionally introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were purified and sequenced. The nt sequence is given in T04199. Sequence 1891 BP; 512 A; 370 C; 425 G; 584 T;

Random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The reverse transcriptase. Nucleotides are unsincorporated by the transcriptase and the molecules are completed to forms that can be manifited and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which cocurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        76 ycdchygccgymrttthhyrrmrbnvyrdynrsdaaawyccyrrsvkydccynachhddh 135

Introducing random point mutations into nucleic acods by prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening.
                                          Introducing random point mutations into nucleic acods - by prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of E.coli beta galactosidase. The wild type sequence was obtained as a Single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are mishncorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Thuman tumour necrosis factor receptors 6-alpha and 6-beta - used in the diagnosis of immune system-related disorder(s)

Disclosure; Fig 1; 91pp; English.

The diagnosis of immune system related disorder(s)

Disclosure; Fig 1; 91pp; English.

The invention also provides

The present sequence represents the human tumour necrosis factor

receptor-6 alpha (TNRR-6 alpha) cDNA. The invention also provides

for the TNRR-6 beta cDNA (V39086). TNRR-6 alpha and TNRR-6 beta are

members of the tumour necrosis factor receptor (TNRR) family. TNRRs

are expressed in endothelial cells, keratinocytes, normal prostate and

particularly of the immune system, substantially altered (whether increased or decreased) levels of TNRR-6 alpha and/or TNRR-6 beta gene expression can be detected, therefore the TNRR-6 alpha and TNRR-6 beta collapsed in the diagnosis of such disorders. Mutations of the TNRR-6 alpha and TNRR-6 beta genes can also be detected. The TNRR polypeptides are claimed to be useful for identifying ligands which may be useful in the treatment of apoptosis related disorders.
                                                                                                                                                                                                                                                                  Human tumour necrosis factor receptor-6 alpha cDNA.

Human tumour necrosis factor receptor-6 alpha; TNFR-6 beta;

Human tumour necrosis factor receptor-6 alpha; TNFR-6 beta;

Endothalial cells; keratinocytes; normal prostate; apoptosis;

Prostate tumour tissue; ss.

Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       V07654,

02-DEC-1998 (first entry)

Nucleotide sequence of tumour necrosis related receptor (TR4).

Human: tumour necrosis related receptor; TR4; agonist; antagonist;

inhibition; chronic; acute; inflammation; arthritis; septicaemia;

autoimmune disease; transplant rejection; stroke; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 2.3%; Score 35; DB 46; Length 1077; Best Local Similarity 94.9%; Pred. ```
identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; page 35: 255pp; Brailsh.

Disclosure; page 35: 255pp; Brailsh.

O70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)11/TGC)(NNB)6Z(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions — a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or blologically active.They may further comprise a linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                        and prevent e.g. inflammation, arthritis, septicaemia, autoimmune diseases, transplant rejection, infection, stroke, ischaemia, ARDS, restenosis, AIDS, bone disorders and cancer.

Claim 3: Fig 1: 21pp: English.

This is the nucleotide sequence of the human tumour necrosis related receptor (TR4), used in the method of the invention. The TR4 protein or its agonist can be used to treat a subject in need of enhanced TR4 polypeptide activity. The antagonist is used to inhibit TR4 polypeptide activity. The active agents can be used for the treatment and prevention of diseases such as chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases, transplant rejection, stroke, cancer, Alzheimer's disease.

resols notifying proteins or peptide(s) which bind a ligand - by
remaining a recombinant vector library expressing fusion proteins
comprising a bluding domain and an effector domain
bisclosure; Page 35; 255pp; English.

070465 is a generic DNA sequence used to generate random TSAR (Totally
Synthetic Affinity Respents) peptides. This generic formula can also be
represented as follows: X(NNB)6(TGC)(NNB)12(NNB)14(TGC)(NNB)3Y. X
and Y are flanking restriction sites (X is not the same as Y) that are
not specified further. Other generic sequences are shown in R5151-54. TSARs are concatenated by these generic sequences are shown in
R65151-54. TSARs are concatenated heterofunctional proteins or peptides,
comprising at least two functional regions - a binding domain with
R65151-54 and a second effector peptide portion that is
chemically or biologically active. They may further comprise a linker
peptide between the 2 domains. The oligonuclectides are also designed so
that the expressed peptide contains 2 or 4 cysteine residues positioned
in, or flanking, the unpredicted or variant residues positioned
in, or flanking, the unpredicted or variant residues. These residues
confer some degree of conformational rigidity to the peptides. The TSARs
or comprising a TSAR binding domain can be used in vivo to
deliver a chemically or biologically active moiety, eg. metal ion,
radioisctope, peptide, toxin or enzyme, to the specific target or on the
                  that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                 0
peptide between the 2 domains. The oligonucleotides are also designed so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            412 IIGGAIGAGCCGTAAIAGGIAGAGCAICAAIIGIIIIGIACACAIGGICIGGGAIAGAAG 353

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Citalm 3.7 Fage //: Supple Lugitary in the method of the nucleotide sequence of the clone CH377], used in the method of the invention involving secreted proteins from human cells potentially useful as immuno-modulators, anti-tumour agents, itssue growth promoters, haemostatic and thrombolytic agents. It was isolated from an adult human testes cDNA library. They may be used to express the recombinant protein, as tissue/molecular weight markers, for chromosome identification, to identify possible genetic disorders and isolate new related DNA, as sources of primers for PCR, to generate anti-protein or anti-DNA antibodies, or in interaction trap assays to identify sequences that encode interacting proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSRs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;
